

Branching stochastic processes as models of Covid-19 epidemic development

Palestine - week 53

N. Yanev, V. Stoimenova, D. Atanasov

Branching stochastic processes as models of Covid-19 epidemic development : Palestine - week 53

Abstract

The results presented here are obtained using the method proposed in the paper <https://arxiv.org/abs/2004.14838> for the country Palestine. The data comes from European Centre for Disease Prevention and Control available at <https://opendata.ecdc.europa.eu/covid19/casedistribution/csv>.

Table of Contents

1. Observed Infection data	1
2. Estimating of the main parameter and some predictions	3

List of Figures

1.1. Number of the weekly reported laboratory-confirmed cases	1
1.2. Number of the total registered cases	2
2.1. The Lotka-Nagaev and the Harris type estimator of the growth rate	3
2.2. Figure	4
2.3. Expected number of the nonregistered infected individuals without immigrati-	
on	5
2.4. Expected number of the nonregistered infected individuals with immigration	6

Chapter 1. Observed Infection data

Figure 1.1. Number of the weekly reported laboratory-confirmed cases

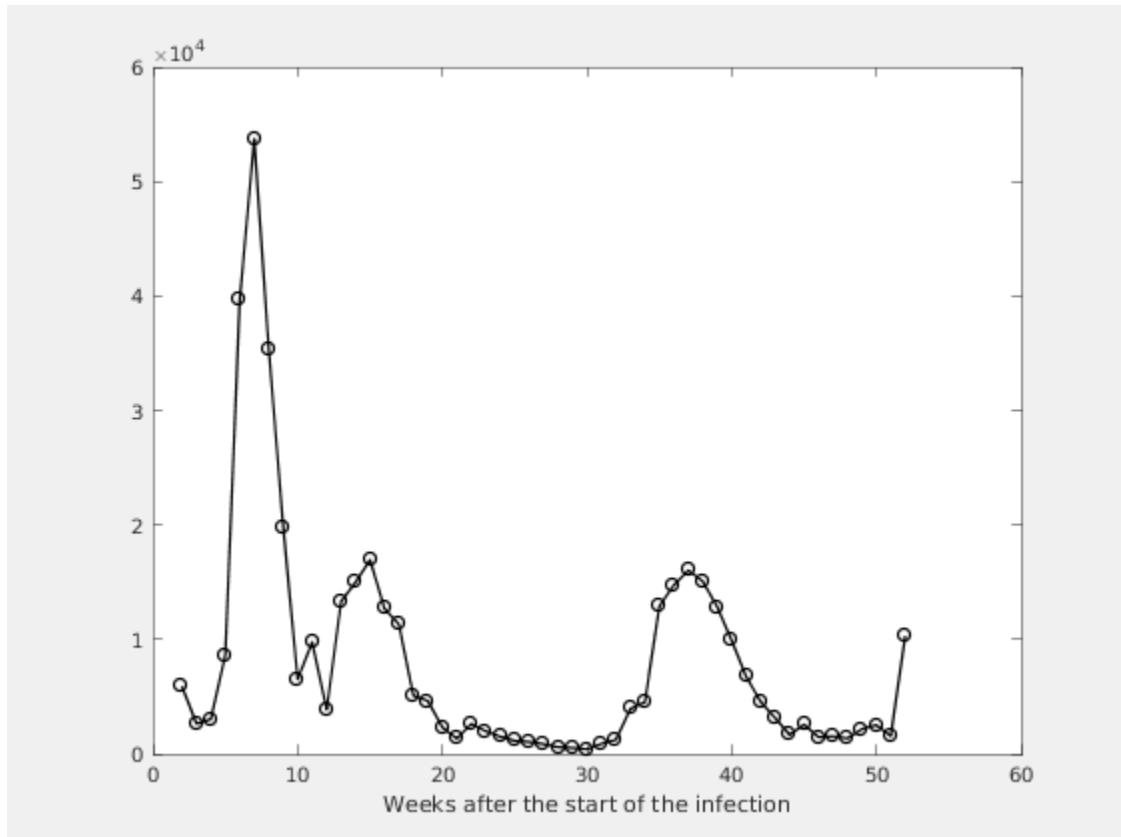

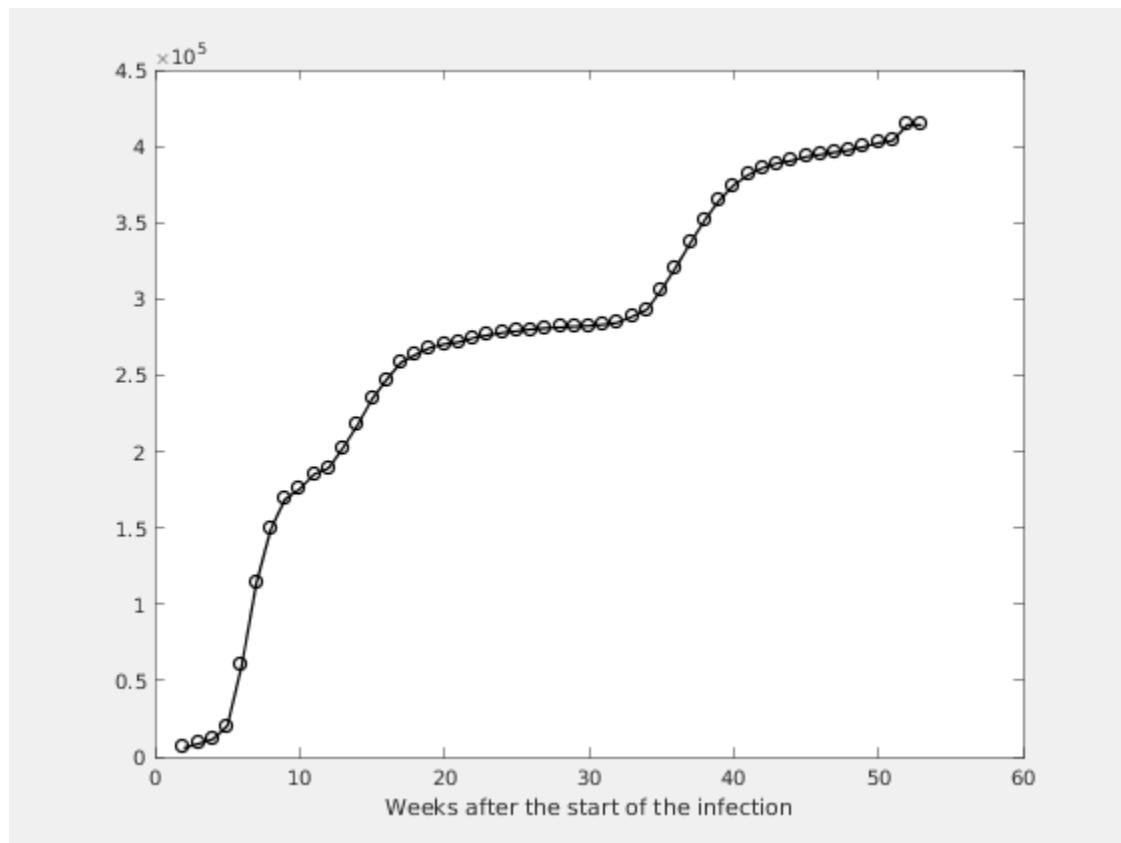

Figure 1.2. Number of the total registered cases

Chapter 2. Estimating of the main parameter and some predictions

Figure 2.1. The Lotka-Nagaev and the Harris type estimator of the growth rate

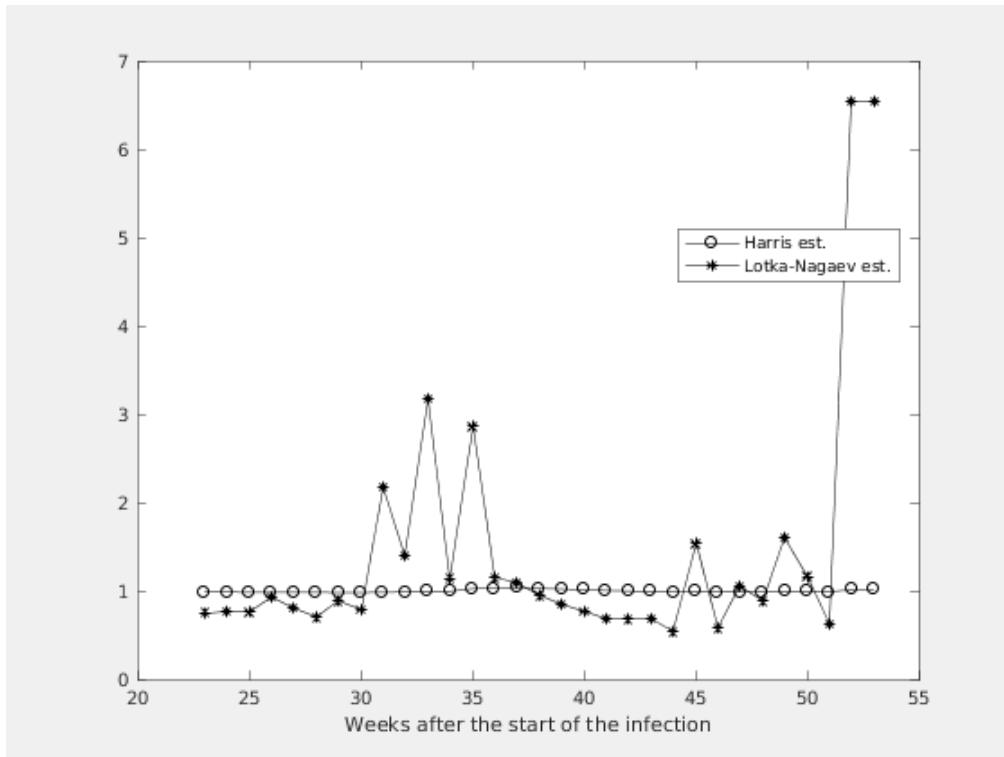

Figure 2.2. Figure

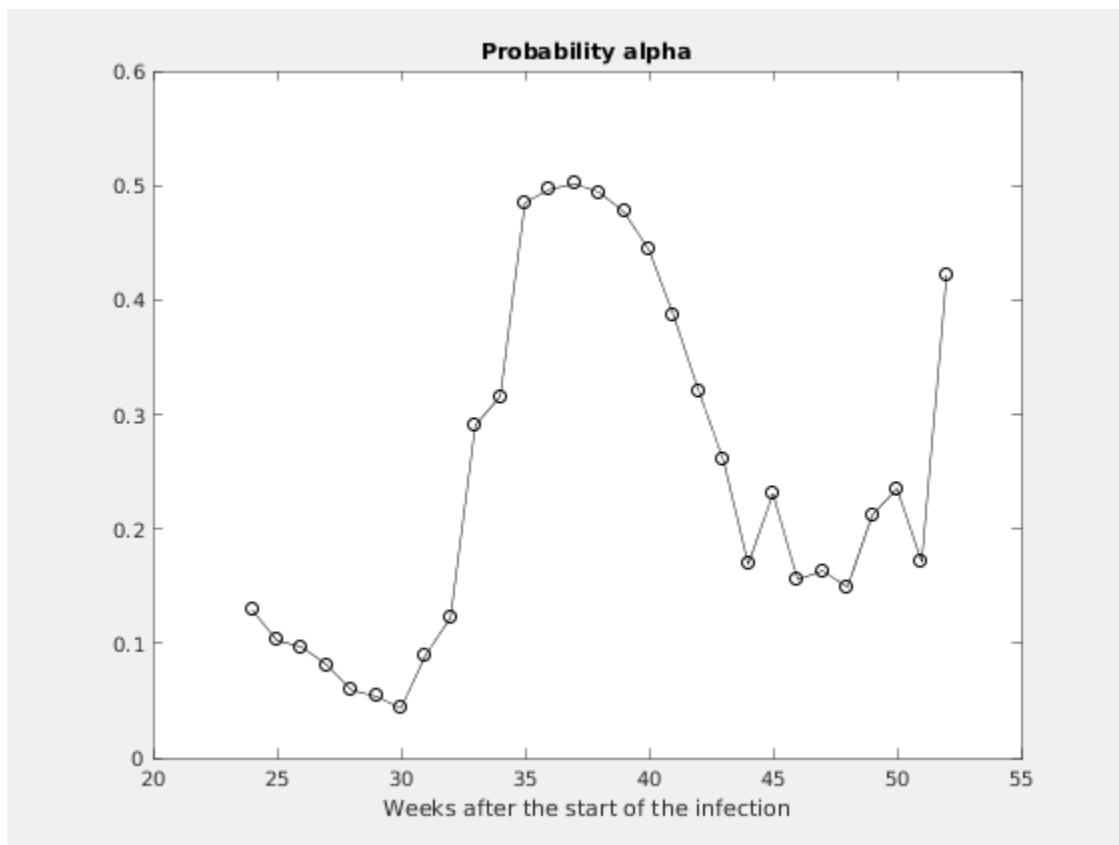

Figure 2.3. Expected number of the nonregistered infected individuals without immigration

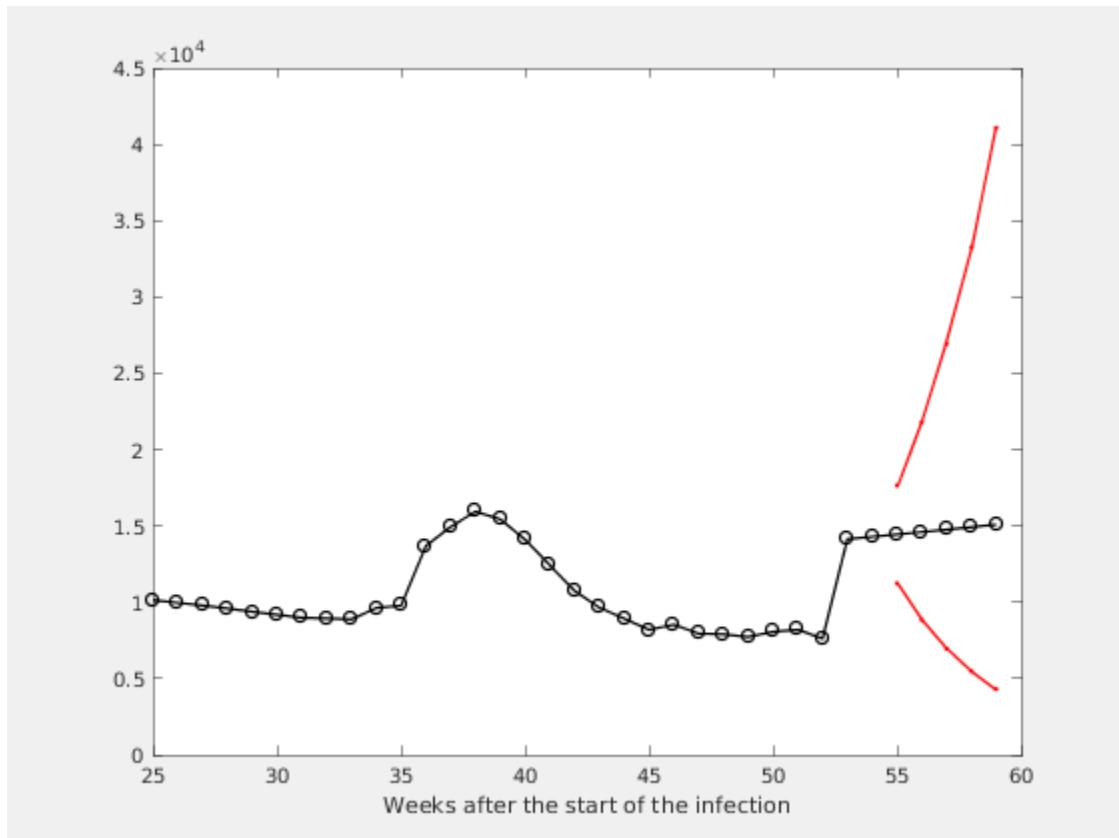

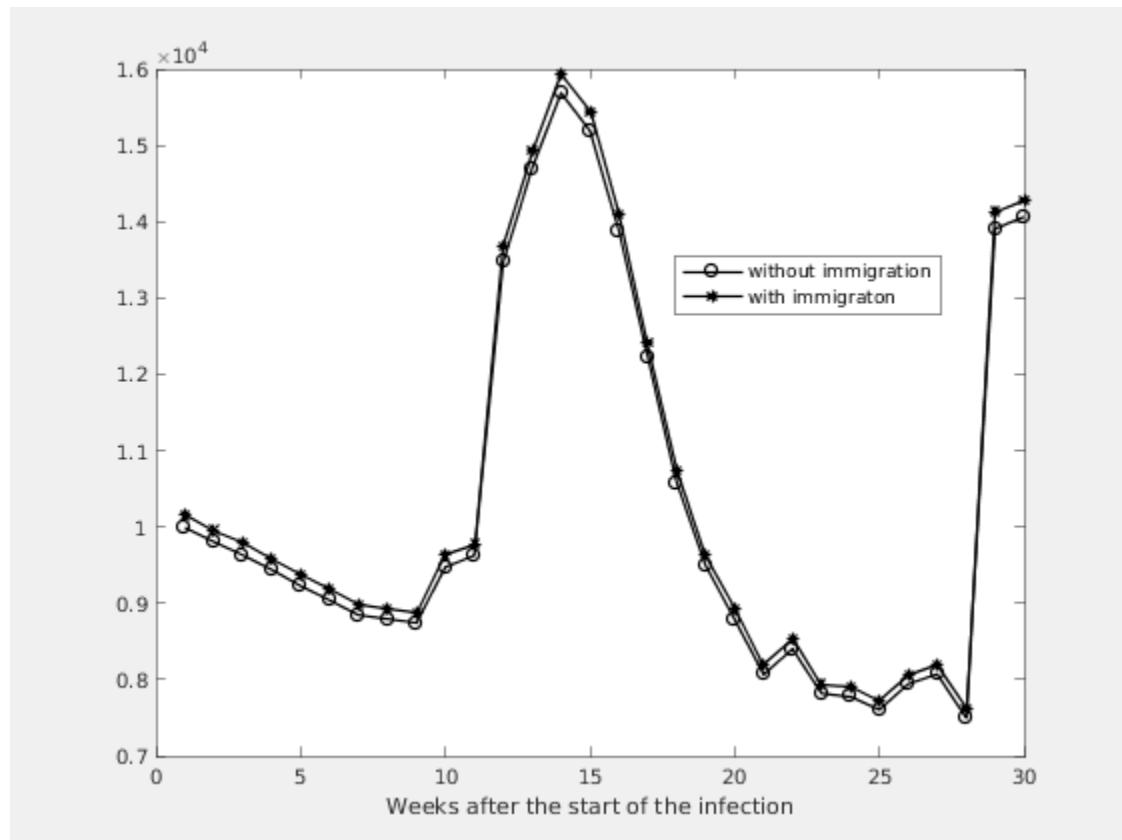

Figure 2.4. Expected number of the nonregistered infected individuals with immigration

Estimation of the model parameters.
